

Sales Performance Dashboard Project Report

1. Introduction

This project analyzes sales data to evaluate business performance across revenue, profitability, customers, regions, and products. A three-page interactive Power BI dashboard was developed to support data-driven decision-making.

2. Abstract

The dashboard highlights total revenue (\$14.30M), total profit (\$3.83M), customer segmentation, and product-level insights. The analysis identifies revenue concentration in key categories and regions and proposes strategies to improve margins, diversify growth, and optimize product performance.

3. Tools Used

- SQL Server Management Studio (SSMS) – Data storage and querying
- Power BI – Data modeling, visualization, and dashboard creation
- DAX (Data Analysis Expressions) – KPI and calculated measures
- Star Schema Model – Fact and dimension table relationships

4. Steps Involved in Building the Project

- Imported sales, customer, product, and store data from SQL Server into Power BI.
- Created relationships using a star schema data model.
- Developed DAX measures such as Total Revenue, Profit, Profit Margin, and Customer Segmentation.
- Designed three dashboard pages: Executive Overview, Customer Insights, and Product Performance.
- Added slicers and interactive visuals for dynamic analysis.
- Derived insights and formulated strategic business recommendations.

5. Conclusion

The Sales Performance Dashboard provides a structured view of business operations and performance drivers. While profitability is strong, analysis revealed category and regional concentration risks. By focusing on margin optimization, customer value expansion, and revenue diversification, the business can achieve sustainable growth. This project demonstrates practical BI development skills, including data modeling, DAX calculations, and executive reporting.
